Problem Statement

Determining the true sale price of an HDB resale flat in Singapore can be a complex task, influenced by a myriad of factors, including location, amenities, surrounding and future town developments, government policies, no. of rooms, etc...

Therefore, we set out on this Data Science project to predict HDB resale prices by building a prediction model (multilinear regression) that can accurately predict prices based on their relevant property attributes.

The given Dataset is an exceptionally detailed one with over 70 columns of different features relating to houses. As part of the process, we also interviewed a real estate agent to get some real-world business insights and to get some directions for where the model should point to.

Questions we will be answering

- Which features appear to add the most value to a home?
- Which features hurt the value of a home the most?
- What are things that homeowners could improve in their homes to increase the value?
- What neighbourhoods seem like they might be a good investment?
- Do we feel that our model will generalize to other cities?

Results from prediction model

The following features have strong positive association to the value of a property:

FEATURES	KEY INSIGHTS
Floor Area (sqm)	Higher floor area intuitively relates to higher cost
Remaining Lease (years)	Preference to maintain ownership of property
Floor Level	Aesthetic/privacy preference
Presence of amenities (Hawker/Mall)	Convenience
Distance to branded secondary school*	Less necessity for closeness

Results from prediction model

The following features have less positive association to the value of a property:

Features	Key insights
Multistorey carpark	Noise/aesthetic concern
3-room units	Socio-economic implications
Distance from branded primary school*	Benefit from being near to the school
MRT Scores*	Accessibility to the city area is valued

Feature Engineering

- Branded Schools

“Every school, a good school.”
- DPM Heng Swee Keat

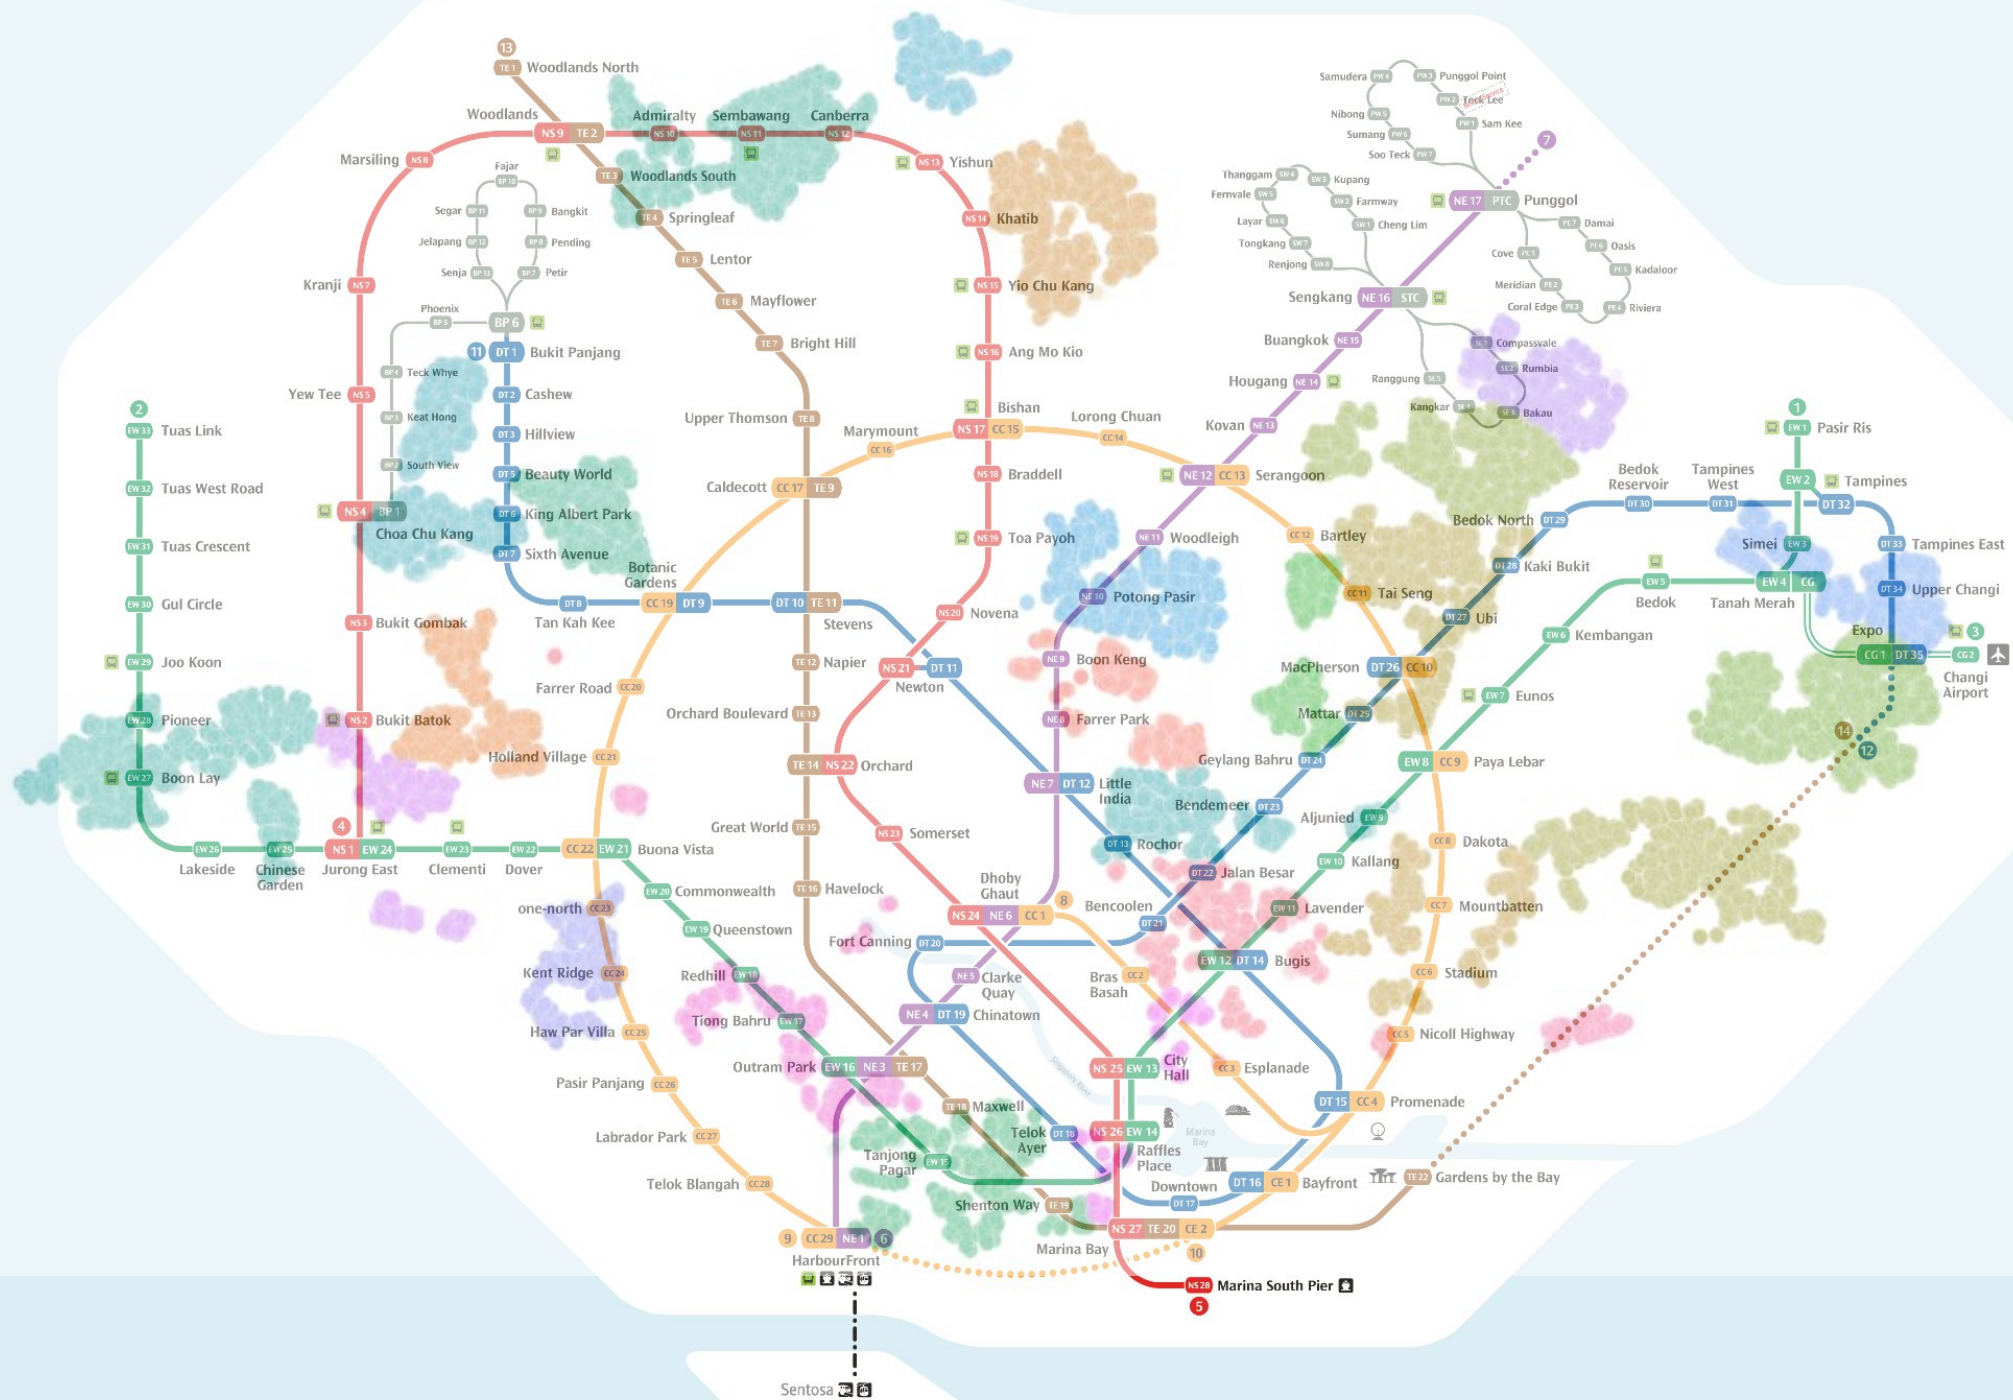

- Convenience of MRT commute

What counts as a “CBD Station”?

Line	Stations
NSL	Raffles Place, City Hall, Marina Bay
EWL	Outram Park, Tanjong Pagar, Raffles Place, City Hall
CCL	Telok Blangah, Harbourfront, Bayfront, Promenade, Esplanade, Marina Bay
DTL	Telok Ayer, Downtown, Bayfront, Promenade
TEL	Maxwell, Shenton Way, Marina Bay

Mean Resale Prices by # of MRT Stations to CBD

Branded Schools - Definition

- **Primary:**

- Schools that offer GEP;
- Affiliated to IP schools;
- Govt. aided.

- **Secondary:**

- Schools that offer IP;
- Govt. aided.

Mean Resale Prices by # of branded primary schools within 2 km

Mean Resale Prices by # of branded secondary schools within 2 km

How does our model perform?

- Predicts resale price to within $\pm 8.5\%$ of the actual value
- That's around $\pm S\$36,500$!

What are things that homeowners could improve in their homes to increase their value?

Improve Interior Furnishings

Finding from our model

- Price premium associated with DBSS apartments

Contextual background

- DBSS (Design Build & Sell Scheme): HDB flats developed by private developers along the lines of condominiums
- DBSS price premium might be due to their more luxurious interior furnishings

“... solid timber doors and high-quality bamboo-strip floorings, which looks better, feels cooler and lasts longer than ordinary parquet ... designer kitchens, deluxe bathroom fittings and premium materials add a touch of luxury to everyday interiors...” [1]

[1] Sales Brochure, Natura Loft @ Bishan. <https://bishan-naturaloft.com/>

DBSS : Natura Loft @ Bishan

What neighbourhoods seem like they might be a good investment?

Towns	Features
Bukit Timah	Proximity to nature reserves, low supply of HDB apartments
Marine Parade	Proximity to the sea, distinctive neighbourhoods (Katong, Joo Chiat)
Bishan	Proximity to well-known parks, nature reserves, small town
Queenstown	Relative tranquility

- Our model reveals that these towns are associated with resale price premiums even after accounting for key features that are explicitly observable from our dataset (as discussed earlier)
- The resale price premiums associated with these towns may thus be due to their other distinctive features, as listed above

Summary

Features Adding Most Value / Features Hurting Value:

Location Location Location

Improvements to Increase Value:

Homeowners could focus on internal improvements to shift their property into a higher flat type category if possible. Renovations that effectively utilize space could also be beneficial.

Good Investment Neighborhoods:

Bukit Timah, Marine Parade, Bishan, Queenstown have higher resale values, making them potentially good investment areas.

Model Generalization to Other Cities:

Our model is tailored to Singapore's unique housing market and may not generalize well to other cities without modifications. To make it more universal, we would need to adjust for local real estate factors, economic conditions, and geographical differences. Data from another city would require similar features (property type, size, age, location specifics) to build a comparable model.
